

## MASONRY

### PARTITION WALL (aluminum carpentry)

The inner side of the façade is plastering to avoid possible seepages. On the ventilated area have been placed polystyrene extruded plates as thermal insulation. The sheeting of the façade is made of single hollow brick laid with plaster paste on which are placed the anchors of aluminum tube which works like window subframe, the blind support, and supports the blind guides. All the carpentry is placed on interior beams of the window hollow.

The partition wall is cladded with a base coat of black plaster and a setting coat of white plaster.

Into the partition wall is the blind cord.
