

## STRUCTURES

### ROOF

The execution of this attic needs the mass in work and of the positioning of elements of lightening (igloo) within which you/they place the superior and inferior armors that form a network of resistant nervous systems.

The armors are mails in proximity of the igloos, they lean on horizontal metallic panels, but through elements, generally realized with material plastic, called "separators" so that stays in suspension so that the concrete can correctly penetrate in the armors.

In the junctions between the attic and the supports, the igloos are not set but they realize him some resistant connections that will duly be armed with armor anti-punzonamento...
