

## SEWAGE

### HANGED SEWAGE

This part of a horizontal sewage is made of with PVC pipes and special pieces (polyvinyl chloride), it is a collector linked to other collectors in an orthogonal way or in the angle that make easy the flow of the water.

On each join exists an inspection though a cap to make easy its cleaning and its maintenance.

The net is hanged though clamps and galvanized steel screwed rod to level it on height.

A neoprene joint should be placed between the collector and the clamps to avoid the transmission of vibrations.
